Wish list for functional analysis package

- Read in and process a simplex file with 3 proportions (2-D simplex with sum to 1 constraint)
 - Read in and process a simplex file with N proportions
- More general output structure to write flat file with rows being simplex points with calculated outputs
- Function outputs for each point in the simplex
 - loglikelihood
 - continuity
 - stochasticity
 - stochasticity derivatives
 - other outputs already calculated
- Other new output
 - divergence of the function gradient at a point
 - capacity to create replicates at one point for stochastic variables
 - capacity to choose output variables
 - create a log file
- Checks
 - Correlations calculated in one test run were outside of the interval $[-1,1]$
 - Covariance calculation
